

Model Questions

Question 01 - HTML and CSS

(a) Create the following HTML page. Use Inline CSS style. Don't use Bootstrap.

- Write the HTML code integrated with CSS to create the full web page shown below. Use inline CSS styles.
- Follow the main instructions; other design elements can be implemented by observing the output.
- Set the title of the document to "Learning Hub".
- Set background color of the body is pink.
- Use the main heading tag to emphasize "Welcome to the AI Learning Hub" in green color.
- Create a hyperlink as "AILearningHub.com" linking to "https://www.learning.com".
- Bold the texts "Explore our courses" and Upcoming Webinar".
- Insert an image named "education.jpg" with dimensions width 200px by height 170px.

Welcome to the AI Learning Hub

Where innovation and education come together.

B. Innovative Learning Environment

- Interactive workshops and training sessions
- Collaborative spaces for AI research and development

Our Core Focus:

Machine Learning Algorithms

Embrace Doggy Kindness Every Day

Let's celebrate the heartwarming kindness of our canine friends, a force that brightens our days.

Pawsitively Kind Acts:

- 1. Wagging Tails for Everyone
- 2. Helping a Pup in Need
- 3. Expressing Gratitude with Licks

Must-Have Doggy Essentials:

- Cozy Bed
- Healthy Dog Food
- Interactive Toys
- Regular Walks

This is a paragraph with **paw-print kindness** and *gentle tail-wagging compassion*.
Spread puppy love in every bark and cuddle.

- (b) Take the output using JavaScript. In this scenario, a user wants to book movie tickets. The movie ticket price is \$400, and the user has a fixed budget of \$20,000. The user can input the number of tickets they want to purchase.
- Calculate the total cost of the tickets and the remaining budget after booking the tickets.
 - The output should display the fixed budget, ticket price, total price of the tickets, and the remaining budget as below.

Movie Ticket Booking
Number of Tickets:

Results
Fixed Budget: \$20,000
Ticket Price: \$400
Total Cost of Tickets: \$8000
Remaining Budget: \$12000

c) Write a JavaScript code snippet to prompt the user to enter the number of kilometers they plan to travel. After the user enters the kilometers, calculate the rental cost according to the distance entered:

- If the distance is less than or equal to 50 kilometers, display an alert box with the rental cost of \$30.
- If the distance is between 51 kilometers (exclusive) and 150 kilometers (inclusive), display an alert box with the rental cost of \$60.
- If the distance is greater than 150 kilometers, display an alert box with the rental cost of \$100.

Output should be displayed in an alert box.

Question 02 (JS)

- a) You're developing an e-commerce application for selling electrical items. Write a JavaScript function to prompt the seller to enter the quantity of items sold. The price of each electrical item is \$500. Calculate the total price and display the result on the web page using document.write. Use JavaScript Functions.

The output should include both the price of each electrical item and the total price. Output should be like this:

- The price of each electrical item is \$500.
- Total price for X items is \$Y.

- b) Create this form using HTML. Write a JavaScript to include the following validations for the data input through the form given below:

- The 'Name' field should not be empty.
- The 'Age' entered should be numeric.
- One of the options should be selected as 'Gender'.

Display suitable messages to the user based on the result of each validation.

Name:

Age:

Gender: MALE ☐ FEMALE ☐

Question 03 (PHP)

- a) Create the following form using HTML (index.html). Create a PHP file (index.php). When the user enters the details to the content and once you clicks the submit button, display the name, email, and password on the php file (index.php) separate page.

index.html

Enter the profile details

Name:

Email:

Password:

index.php

User Details

Name: Shevin De Silva

Email: shevin@gmail.com

Password: shevin12345)

- b) Assume that a database called university has already been created in MySQL. Write a PHP program to create a table named staff in the university database. The staff table should have the following columns: id, name, and email. After creating the table, display the message "Table created successfully" on the web page.
- c) Assume that a database called university has already been created in MySQL and a table named staff has been created with the columns id, name, and email. Write a PHP program to insert a record into the staff table. The record should include the name and email address of the staff member. After inserting the record, display the message "Record inserted successfully" on the web page.
