

Web-Based Application Development

25.3 Faculty of Computing

Lab sheet 11

Task 1 - Creating the Database and Registration Form

Create a database named **Student_DB** in your local MySQL server.

Create a table named **student** with the fields – id, name, email, course.

Create an HTML file named **register.html** that contains a registration form with the following fields:

- Student ID
- Student Name
- Email
- Course

The form should submit its data to **save.php** using the **POST** method.

Task 2 - Handling Form Submission

Create a PHP file named **save.php** to process the submitted data.

Your script should perform the following tasks:

- Retrieve the submitted values using the **\$_POST** superglobal.
- Connect to the **Student_DB** database using **mysqli_connect()**.
- Insert the student details into the **student** table.
- Execute the query using **mysqli_query()**.
- Display the message:

Student record inserted successfully.
if the insertion is successful.

Include a hyperlink that redirects the user to **view.php** to display all student records.

Task 3 - Display Student Records

Create a PHP file named **view.php**.

Your script should:

- Connect to the **Student_DB** database.
- Retrieve all student records and display the records inside an HTML table.

The table should contain the following headings:

- Student ID
- Name
- Email
- Course

Use a **while** loop together with **mysqli_fetch_assoc()** to dynamically display all records.

At the bottom of the page, include a hyperlink that redirects the user back to **register.html**.
