

Web-Based Application Development

25.3 Faculty of Computing

Lab sheet 09

Task 1 - Electricity Bill Calculator

Create a PHP web application that includes a form to accept the following inputs:

- Customer Name
- Units Consumed

After submitting the form, the program should calculate the electricity bill using the following conditions:

Units	Rate
First 100 units	Rs. 10 per unit
Above 100 units	Rs. 15 per unit

The system should display:

- Customer Name
- Units Consumed
- Total Electricity Bill

The calculation should be done using PHP and the result should be displayed dynamically on the same page.

Electricity Bill Calculator

Customer Name:

Units Consumed:

Bill Details

Customer Name: John
Units Consumed: 120
Total Electricity Bill: Rs. 1300

Task 2 - Student Registration and Login Validation System

Create a PHP web application that contains a form with the following fields:

- Student Name
- Age
- Email
- Username
- Password

When the user clicks Submit:

1. Display the entered student details.
2. Validate the login credentials using the following conditions:
 - Username = admin
 - Password = 1234
3. If the credentials are correct, display "Login Successful".
4. Otherwise, display "Invalid Username or Password".
